

Edge Computing Stack Icons

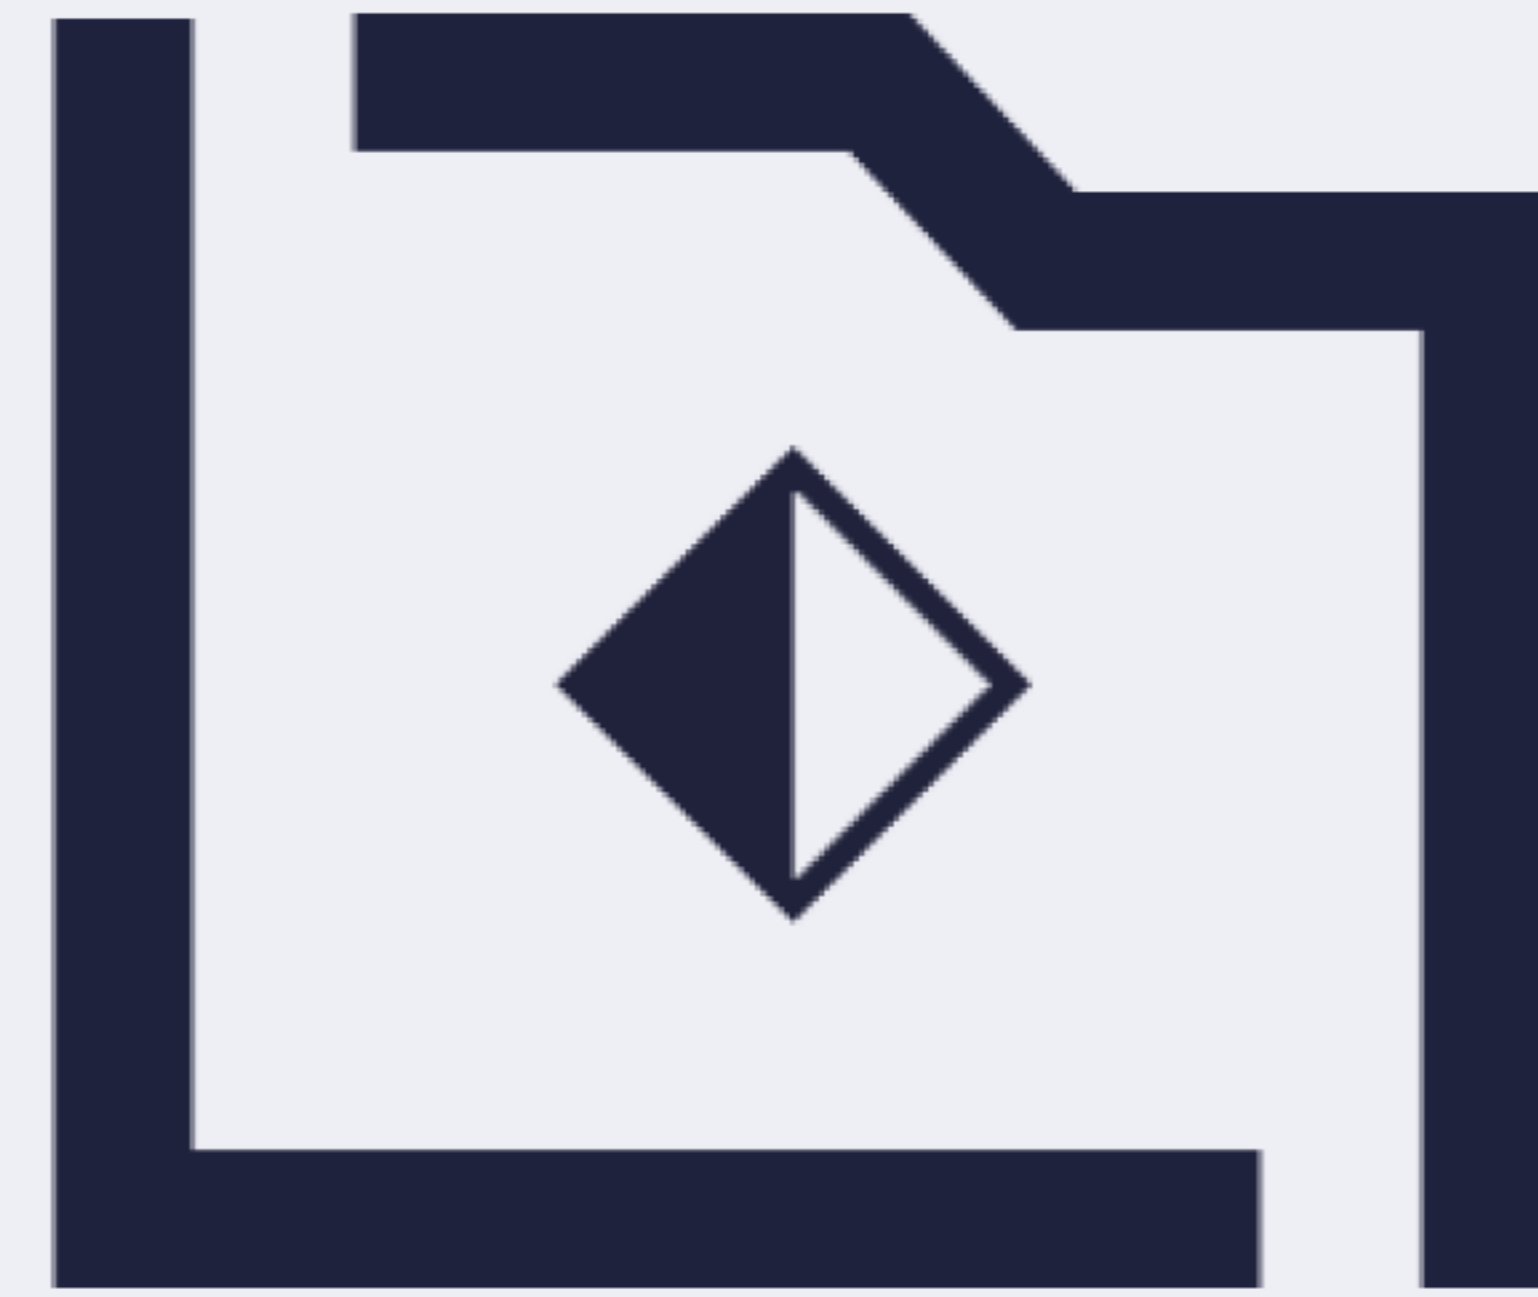

WNFS

Options

For WNFS we chose the iconography of a folder. An easy way to evoke the idea of data storage.

The symbol inside of it represents the whole edge computing stack.

WNFS: Webnative File System

The Webnative File System (WNFS) is a distributed file system built on IPFS. It is versioned, logged, programmable, encrypted, and fully controlled by the end user.

Developers are used to running a server to hold user data when publishing an app online. During the prototyping process, dummy data is often stored in the browser. We realized that if we made the browser capable of running production data, it would ensure the data was local-first and private (because the data would never have to leave the device itself).
